Working Principle of Transformers (Based on JB Gupta Text)

The operation of a transformer hinges on electromagnetic induction, which can be summarized as follows:

- When an alternating voltage is applied across the primary winding, it produces an alternating current.
- This current generates a time-varying magnetic flux in the core.
- The changing flux induces an electromotive force (EMF) in the secondary winding, according to Faraday's law.
- The magnitude of the induced EMF depends on the ratio of the number of turns in the primary and secondary windings.

Mathematical Expression

\[

$$\frac{V_1}{V_2} = \frac{N_1}{N_2} = \text{Turns Ratio}$$

\]

Where:
